

WREXLYN

USE CASES

One AI teammate. Seven everyday jobs, done end to end.

Code

Documents

Research

Automation

by Nishant Prabhakar

HOW TO READ THIS DECK

One system. Many kinds of work.

Wrexlyn is one AI teammate you give plain-English instructions to. It plans the work, does it inside your own files and tools, checks its own result, and shows you the proof — across four broad kinds of work.

Code

Fix, build, and ship software

Documents

Real Word, Excel & PowerPoint files

Research

Answers backed by real sources

Automation

Acts inside your everyday tools

USE CASE 1 · SOFTWARE ENGINEERING

Ship working code, not just suggestions

“Fix a bug, add a feature, or clean up messy code — and prove it actually works.”

HOW IT WORKS

- 1 Reads your actual codebase first, so changes fit how your project already works.
- 2 Makes the change directly in your files — no copy-pasting code out of a chat window.
- 3 Runs your real tests and build before calling the job done, and can undo everything with one click if something's wrong.

IN PLAIN WORDS

You ask: “Fix the login bug and make sure nothing else breaks.”

You get back a tested, working patch — with the test results to prove it.

USE CASE 2 · BUSINESS DOCUMENTS

Get a finished file, not a wall of text

“Turn a request into a real Word report, Excel model, or PowerPoint deck.”

HOW IT WORKS

- 1 Produces actual formatted documents — headings, tables, a working table of contents — not markdown pasted into a text box.
- 2 Excel comes out with live, recalculating formulas, not numbers typed in by hand.
- 3 PowerPoint slides use real, editable charts and layouts designed for the content, not just a title and five bullet points.

IN PLAIN WORDS

You ask: “Build a 10-slide investor deck from this research.”

You get an actual .pptx file, ready to open and present — today.

USE CASE 3 · RESEARCH & DILIGENCE

Answers you can actually check

“Answer a hard question, and show your work so I can trust it.”

HOW IT WORKS

- 1 Pulls facts from your own files and the web, and keeps track of exactly where each one came from.
- 2 Flags it when a new figure contradicts something it found earlier, instead of quietly overwriting it.
- 3 Keeps the same numbers consistent across every report, memo, or slide it writes about the same topic.

IN PLAIN WORDS

You ask: “Summarize this company's financials and flag any red flags.”

You get a sourced write-up — every claim traceable back to evidence.

USE CASE 4 · SAFE EXPERIMENTATION

Let it take real action — without the fear

“I want it to actually do things, but I need an undo button I can trust.”

HOW IT WORKS

- 1 Every file is captured exactly as it was, the instant before anything touches it.
- 2 One click restores an entire turn's changes — no manual cleanup, no guessing what changed.
- 3 A risky action always asks first; nothing destructive ever runs silently in the background.

IN PLAIN WORDS

You try a big refactor. It doesn't work out — one click, and every file is back exactly how it was.

USE CASE 5 · AUTOMATION

Put it to work inside your everyday tools

“Let it read and act inside the tools I already use — with my say-so at every step.”

HOW IT WORKS

- 1 Connects to Gmail, Google Drive, Calendar, OneDrive/SharePoint, Dropbox, and more.
- 2 Anything it reads from outside is treated as information, never as a secret instruction to obey.
- 3 You approve what it's allowed to touch — nothing acts on your accounts without permission.

IN PLAIN WORDS

You ask: “Check tomorrow's meetings and draft a follow-up email for each.”

It works inside your real calendar and inbox — you review before anything sends.

USE CASE 6 · MODEL FREEDOM

Pick the AI brain that fits the moment

"I don't want to be locked into one AI company — or pay for power I don't need."

HOW IT WORKS

- 1 Works with free and paid cloud models from multiple providers, side by side.
- 2 Can run entirely on your own machine with a local model — nothing has to leave your computer.
- 3 Same project, same memory, same rules — switch models mid-conversation without losing anything.

IN PLAIN WORDS

Use a free model for a quick task, switch to a stronger one for something hard — same conversation, same files.

USE CASE 7 · INDUSTRY SOLUTIONS

Purpose-built solutions for your industry

"I don't just want a general AI — I want something that already understands my industry."

HOW IT WORKS

- 1 The same underlying engine also powers ready-made, industry-specific products.
- 2 Wrexlyn for Investments is the first: built for private equity teams doing screening, deal evaluation, and document review.
- 3 It produces real IC notes and financial models — not generic chat answers about your deal.
- 4 More industry-specific versions are on the way — the same core, tuned for a new domain each time.

REAL EXAMPLE

A PE analyst asks for an initial screen on a target company — and gets a structured evaluation with a real, editable financial model attached.

AUDIENCE

Who is this actually for?

**Developers & engineering teams**

Ship tested changes faster, without babysitting every step.

**Analysts & researchers**

Turn raw information into sourced, checkable deliverables.

**Founders & operators**

Get real code, decks, and reports done without a big team.

**Security-conscious teams**

Keep code, data, and models under your own control.

AT A GLANCE

Every use case, in one place

**Software engineering**

Fix, build, and ship tested code changes

**Business documents**

Real Word, Excel & PowerPoint files, not text dumps

**Research & diligence**

Sourced answers you can actually verify

**Safe experimentation**

Every change reversible, one click to undo

**Automation**

Acts inside Gmail, Drive, Calendar & more

**Model freedom**

Any cloud model, or fully local — your choice

**Industry solutions**

Purpose-built products like Wrexlyn for Investments

One teammate. Every kind of work.

See it work on your own project.
